

ABSTRACT

The objective is to realize a measurement system and measurement method enabling highly reliable communication.

The present invention improves upon a measurement system comprising a setting apparatus which causes network address settings to be made in measurement instruments through a network. The measurement instruments of this system are characterized in that they comprise the following: a sending/receiving means which communicates with an external apparatus or setting means through the network; a judgment means which judges whether this sending/receiving means is communicating through a connection-oriented connection; and a setting means which performs network address settings based on the judgment results of this judgment means.
